

Sprint 3 Artifacts:

1. Sprint 3 Requirements Stack Spreadsheet
 - a. Updated the spreadsheet for the new sprint. After sprint 1, we gained a clearer view of how our project was progressing. We updated Sprint 3 requirements in the requirements spreadsheet to reflect these changes.
2. Sprint 3 Requirements Artifacts
 - a. Outlined artifacts for the next sprint. We planned by determining what deliverables we want to provide for the sprint 3 release. We documented these updates in our Sprint Artifacts document.
3. Peer Evaluation 4
 - a. Submit the sprint 3 peer evaluation on Canvas. This evaluation splits \$10,000 among our group members based on their contributions to the group's progress.
4. Sprint 3: GitHub link for Sprint Release
 - a. A fully updated GitHub repository link was submitted to Canvas, with a timestamp close to the Sprint 3 deadline, and a clear, consistent commit history showing progress across development areas.
5. Keep GitHub up to date for the sprint 3 submission.
 - a. Ensure that GitHub is ready to submit by always uploading the latest documents and code. Ensure that GitHub has all sprint 3 deliverables before submission.
6. Find placeholder assets for level 3
 - a. Use placeholder assets in our level design to plan for what level two will look like. By using placeholder assets, we can create the level even when our artwork or sound effects have not been finalized.
7. Record Sprint 3 presentation video script.
 - a. Write and record the presentation video showing off each feature in a clear and efficient manner. This video should exemplify all of the progress that we have made towards InternStellar throughout the previous semester and current sprints.
8. Make room layout mockups.
 - a. Design visual mockups for game rooms or levels to plan the placement of interactive objects and player movement paths. These mock-ups will provide a clear visual reference for understanding how the environment will look and function in the final version.
9. Make a Level 3 Pac-Man game
 - a. Design and implement logic for Pac-Man style game for the intern to discover the holding rooms which may be where her team is being kept. The intern will see a map and click on it which will take her to a packman maze. Aliens act as the ghosts, and this introduces the first opportunity to fail a level.
10. Create Level 3 Spaceship room (interactive)

- a. This room will emulate the spaceship that the intern gained access to in the pervious level. Similar to the level 1 lobby, the intern will click around and learn more about the area before discovering the map (and therefore the Pac-Man game)
- 11. Create pixel art for the Spaceship room.
 - a. Using the mockups, draw the final versions of the rooms for the game. The room art will follow a consistent art style, like our other levels, using pixel art.
- 12. Create a cutscene for Alien interaction.
 - a. Create a cutscene for the alien interaction where the intern encounters the alien for the first time. This cutscene then triggers into a Chapter 3 complete scene.
