

Sprint 2 Artifacts:

1. Sprint 2 Requirements Stack Spreadsheet
 - a. Updated the spreadsheet for the new sprint. After sprint 1, we gained a clearer view of how our project was progressing. We updated Sprint 2 requirements in the requirements spreadsheet to reflect these changes.
2. Sprint 2 Requirements Artifacts
 - a. Outlined artifacts for the next sprint. We planned by determining what deliverables we want to provide for the sprint 2 release. We documented these updates in our Sprint Artifacts document.
3. Updated Agile Reference Stories spreadsheet
 - a. Update the Agile Reference Stories spreadsheet based on the new developments. We updated the descriptions to match the required word counts. We initially lost a couple of points from this on our first submission.
4. Peer Evaluation 2
 - a. Submit the sprint 2 peer evaluation on Canvas. This evaluation splits \$10,000 among our group members based on their contributions to the group's progress.
5. Sprint 2: GitHub link for Sprint Release
 - a. A fully updated GitHub repository link was submitted to Canvas, with a timestamp close to the Sprint 1 deadline, and a clear, consistent commit history showing progress across development areas.
6. Keep GitHub up to date for the sprint 2 submission.
 - a. Ensure that GitHub is ready to submit by always uploading the latest documents and code. Ensure that GitHub has all sprint 1 deliverables before submission.
7. Find placeholder assets for level 2
 - a. Use placeholder assets in our level design to plan for what level two will look like. By using placeholder assets, we can create the level even when our artwork or sound effects have not been finalized.
8. Brainstorm Sprint 2 presentation video script.
 - a. Create the rough draft and script for our presentation video showcasing the work we have completed through sprint 2. It should give our classmates and professors a thorough understanding of what InternStellar is and how it was made.
9. Make room layout mockups.
 - a. Design visual mockups for game rooms or levels to plan the placement of interactive objects and player movement paths. These mock-ups will provide a clear visual reference for understanding how the environment will look and function in the final version.
10. Make room art
 - a. Using the mockups, draw the final versions of the rooms for the game. The room art will follow a consistent art style, like our other levels, using pixel art.

11. Make Save Feature

- a. Implement a save system to store the player's progress. This includes completed levels and any milestones. This feature will allow players to continue from their last checkout instead of restarting the game.

12. Make a Level 2 Constellation Puzzle

- a. Create the constellation puzzle that will begin level 2. The player must play connect the dots with the stars to reveal an alien spaceship in the center. This will transition the player to the second half of level 2.

13. Make a Level 2 Nonogram Puzzle

- a. Create the nonogram puzzle that will trigger the end of level 2. The solved nonogram will look like a rocket ship. Solving the nonogram will grant the player access to the alien spaceship.

14. Create Level 2 Cutscene Transitions

- a. Create a cutscene that transitions the player to the alien spaceship after solving the constellation connect-the-dots.
- b. Create a custom scene that transitions the player into the alien spaceship after solving the nonogram puzzle.
