

Sprint 1 Artifacts:

1. Write the story for 6 total levels
 - a. Develop the story progression for all six game levels. Each level builds on the intern's journey, introducing new challenges, environments, and story elements that gradually increase in complexity and reinforce the overall storyline.
2. Storyboard Ideas
 - a. Create a level-by-level outline describing the setting, objectives, puzzles, and story beats for each game level. This helped ensure narrative continuity and set clear goals for development across sprints.
3. Update Initial Architecture Document
 - a. Updated the Internstellar Architecture 2 Document to outline the game's structure, systems, and designs
 - i. Overview: defined the game as a 2D point-and-click game built with Godot. It will contain scenes, puzzles, and bubble dialogues.
 1. Point-and-click aspect: detecting objects, triggering interactions (inventory, speech bubbles, minigames).
 2. Map navigation aspect: explain how the player navigates between scenes.
 3. Hint system aspect: define logic for detecting incomplete tasks and guiding players using object highlighting or speech bubble hints.
 4. Game story: describe the setting, the intern, and the puzzles.
4. Sprint 1 Requirements Stack Spreadsheet
 - a. Updated the spreadsheet for the new sprint. After sprint 1, we got a better idea of how our project was progressing. We updated Sprint 2 requirements in the requirements spreadsheet to reflect these changes.
5. Sprint 1 Requirements Artifacts
 - a. Outlined artifacts for the next sprint. We planned ahead by determining what deliverables we want to provide for the sprint 2 release. We documented these updates in our Sprint Artifacts document.
6. Updated Agile Reference Stories spreadsheet
 - a. Update the Agile Reference Stories spreadsheet based on the new developments. We updated the descriptions to match the required word counts. We initially lost a couple of points from this on our first submission.
7. Peer Evaluation 1
 - a. Submit the sprint peer evaluation on Canvas. This evaluation splits \$10,000 between our group members based on contribution to the groups progress.
8. Updated Requirements Stack spreadsheet
 - a. Update the Requirements Stack spreadsheet based on the feedback from the sprint 1 submission. Reorganized the spreadsheet to better reflect the logical progression

of development. Each requirement was prioritized according to importance and feasibility for the next sprint

9. Sprint 1: GitHub link for Sprint Release

- a. Submitted the GitHub link to Canvas for grading. Ensured all deliverables were ready.

10. Keep GitHub up to date for the sprint 1 submission

- a. Organized the GitHub for timeline clarity for the final sprint submission. Ensured that code, documents, and diagrams are separated from each other to ensure maximum readability.

11. Skip through dialogues

- a. Clicking anywhere on the screen when a dialog is opened will cause the current line to complete. If the line is already finished, the next line will begin. If there are no more lines of dialogue, the dialogue box will go away. This will allow the player to exit dialogs they are not interested in.

12. Create pixel art for level 2

- a. Design pixel art assets for level 2, including backgrounds, interactive objects, and environmental details. The art style was kept consistent with earlier levels to maintain visual cohesion across the game. This includes artwork for a constellation pointing to the alien spaceship.

13. Create game logic for level 2

- a. Implement the core gameplay logic for level 2, including object interactions, puzzle conditions, inventory usage, and progression triggers. This ensured the level was fully playable and aligned with the intended narrative flow. This includes the connect-the-dot functionality of the constellation and the nonogram puzzle to unlock the alien spaceship door.
